RECALLBOX

ABSTRACT

RecallBox is a personalized knowledge-retention and smart revision system designed to help learners improve their learning efficiency and retain information over time. Unlike conventional quiz applications that primarily focus on testing and scoring, RecallBox focuses on determining what a learner should revise, when it should be revised, and which topics require greater attention.

This is a rule-based adaptive revision engine that uses accuracy, question difficulty, confidence, and previous revision history to determine the priority and timing of future reviews. The system also provides weak-topic detection, progress tracking, revision history, analytics, and a dashboard for managing upcoming revision tasks.

RecallBox is developed as a Python-based desktop application using Tkinter for the graphical user interface and SQLite for local data storage, allowing the core revision workflow to operate offline.

MODULES

- **User & Question Management** – users, subjects, topics, and questions.
- **Revision & Smart Scheduling** – answer questions, track performance, and schedule the next revision.
- **Dashboard & Analytics** – progress, weak topics, revision history, and upcoming revisions.

ROLE OF MEMBERS :

A S Anand : User & Question Management

Abhiraj M : Revision & Smart Scheduling

Aarathi C S : Dashboard & Analytics

TECH STACK :

- **Frontend:** Pyside /Tkinter
- **Backend:** Python + Django
- **Database:** SQLite
- **Optional:** AI API / ML Implementation

GROUP 1

GUIDE : Asst. Professor Dr. SHEERA SHAMSU

A S ANAND - 26MCA01

AARATHI C S -26MCA02

ABHIRAJ M -26MCA03
